Helicobacter pylori (H pylori) infection is one of the most common chronic bacterial infections worldwide. A systematic review and economic analysis of 52 studies found that eradication of H pylori infection is associated with a reduction in the risk of developing Barretts oesophagus. A meta-analysis of patients with peptic ulcer disease who were successfully eradicated of their H pylori and erosive esophagitis and Barretts esophagus showed a benefit for H pylori eradication on gastric cancer. There is general agreement that screening for Barretts esophagus using endoscopy is a more recent (2011) systematic review suggested that the response of non-cardiac chest pain to H pylori infection is not recommended in GERD patients. All three developers also reviewed published meta-analyses.
